BIOCHEMISTRY MAJOR (2012 onwards)

Objectives:

The Major in Biochemistry aims to provide students with both basic and advanced knowledge in contemporary **biochemistry and molecular biology**. Core courses in the curriculum emphasize equipping students with a general understanding of the fundamental ideas, principles and theories of biochemistry with particular focus on the relevance of biochemistry, molecular biology and genomics to **biology, human health and disease**. Elective courses extend this core knowledge to provide students with specialized insight into both basic and applied scientific endeavour in biochemistry, bioinformatics, molecular biology and molecular genetics. Throughout the curriculum there is an emphasis on experiential learning through laboratory practicals, problem-solving exercises, group-based learning, industrial experience, overseas exchange and research-based projects. These experiences are designed to develop students' ability **to read and interpret scientific data, to integrate knowledge with wider scientific theory, and to improve logical thinking and communication skills**. The ultimate goal is to provide a comprehensive degree-level biochemistry education that equips students with the critical thinking, communication and analytical skills essential for them to play a leading role in society in the future.

Learning Outcomes:

By the end of this programme, students should be able to:

- (1) **describe the principles** of biomolecular structure, metabolism, molecular interactions, molecular processes and their regulation, genetics and systems biology critical to contemporary biochemistry and molecular biology
(by means of coursework and experiential learning)
- (2) **apply** biochemical, bioinformatics and molecular genetics technologies for new observations, measurements and analyses; **and to design experiments that bring discovery and insight into the unknown**
(by means of laboratory-based and research project-based learning)
- (3) **interpret and communicate scientific data and literature using appropriate scientific language**
(by means of literature-based coursework and debate)
- (4) **work effectively as a team** and synergize with their colleagues in a supportive manner
(by means of group-based learning and by group-based problem solving)
- (5) **recognize the interconnections of biochemistry with other disciplines** in science, medicine and engineering, humanities and ethics, which are relevant for diverse working environment in the society
(by means of multidisciplinary-based research projects, internship and debate)
