Master of Science in the field of PHYSICS

Incubating talent pool of well-versed cadres in physics

2024-25 (September 2024 intake)
Where will this Programme Lead You

Transferable skills
- The problem-solving skills, in particular with quantitative and analytical techniques, bode well for all graduates with a formal physics training

Career development
- Master degree holders in physics with advanced preparation in mathematics, laboratory skills, and programming are highly valued by many employers, allowing these graduates to enter the job market through multiple channels
- Prepares quality physicists for the high-technology workplace

Host

Department of Physics

The Department of Physics conducts research at the cutting edge of fundamental and applied physics. The overarching research vision of the Department is to become locally pre-eminent, leading in Asia, and globally competitive in selected sub-fields of research. Our researchers engage in frontier research in the fields of Astronomy and Astrophysics; Computational Physics; Theoretical and Experimental Condensed Matter Physics; Materials Sciences; Nuclear and Particle Physics; Photonics and Quantum Information. We also incorporate advanced research in teaching and offer a number of postgraduate projects to nurture well-versed individuals.

Who should Take this Programme

Students who intend to pursue another master or doctoral degree in a wide range of science or engineering disciplines in the future

Students who would like to enhance their competitiveness in high-tech industry

Hear from our graduates

Zhou Yijun
Class of 2023

I have learned a lot from the physics master’s programme. The Department offers us a variety of courses, covering astrophysics, theoretical physics, condensed matter physics, etc. Here I can choose any course I like, and the Professor’s serious attitude toward teaching is very impressive. At the same time, the Department also sets up the capstone project for each student. We can freely choose topics of interest to participate in research. I am very grateful for everything I have learned at HKU, and thanks all the Professors who helped me in the Department of Physics. The experiences of HKU inspire me to continuously break through myself in the future!

Li Tianyi
Class of 2023

It was not a long study year, but I benefited a lot. The course arrangement of the Department is very thoughtful. For example, the regular physics seminars allowed us to learn about the latest scientific research progress in related fields and broaden our horizons. Also, the capstone project allowed us to choose from different research directions according to our interests. Under the supervisor’s guidance, I could fully realise my potential and develop the ability to solve seemingly impossible problems. In addition to academic improvement and career inspiration, I got to know many excellent teachers and classmates; they gave me great support and encouragement which I will never forget. I have been working as an EDA product engineer in Empyrean after graduation.
WHAT YOU WILL LEARN

Compulsory Courses

PHYS8201 Basic research methods in physical science
This course introduces basic research methods commonly used in various sub-fields in physics. It comprises of four modules, each introduces commonly used research methods in physics. Students are required to take two out of the four modules. They are 1. Astrophysical techniques: Commonly used techniques and packages in astrophysical data gathering and data analysis are introduced. 2. Computational physics and modelling techniques: Commonly used computational physics and physical modelling methods are introduced. 3. Experimental physics techniques: Commonly used experimental physics apparatus and techniques are introduced. 4. Theoretical physics: Commonly used techniques in mathematical and theoretical physics are introduced.

PHYS8970 Physics seminar
This course aims to initiate students into research culture and to develop a capacity for communication with an audience of varied backgrounds. Students attend and take part in a specified number of colloquia and seminars organised by the Department of Physics to expose themselves to various topics of contemporary physics research and to learn the technique of professional physics presentations. Students are required to give an oral presentation, normally on materials related to their Capstone Project. Students are also required to submit assignments based on the colloquia attended to receive a pass in this course.

Disciplinary Elective Courses

PHYS8150 Computational physics and its contemporary applications
This course shows the power of computational approach to solving physics and related problems, which is complimentary to the traditional experimental and theoretical approaches. Students are expected to spend a significant fraction of time in actual programming. Topics include: Introduction to computational physics; ordinary differential equation for classical physical problems; partial differential equation for classical and quantum problems; matrix method and exactly diagonalisation for classical and quantum problems; Monte Carlo methods for statistical physics and quantum many-body physics; numerical methods for phase transitions and machine learning approaches to physics problems.

PHYS8351 Graduate quantum mechanics
This course introduces postgraduates to the theory and advanced techniques in quantum mechanics, and their applications to selected topics in condensed matter physics. The course covers the following topics: Dirac notation; quantum dynamics; the second quantisation; symmetry and conservation laws; permutation symmetry and identical particles; perturbation and scattering theory; introduction of relativistic quantum mechanics.

PHYS8450 Graduate electromagnetic field theory
This course covers advanced topics in equilibrium and non-equilibrium statistical physics. The course covers the following topics: Boundary-value problems in electrostatics and Green’s Function method; electrostatics of media; magnetostatics; Maxwell’s equations and conservation laws; gauge transformations; electromagnetic waves and wave guides.

PHYS8550 Graduate statistical mechanics
This course covers advanced topics in equilibrium statistical physics. Topics include: Ensemble theory; theory of simple gases, ideal Bose systems, ideal Fermi systems; statistical mechanics of interacting systems; statistical field theory; some topics in the theory of phase transition may be selected.

PHYS8701 Physics experimental techniques
This course provides a detailed account of some common experimental techniques in physics research. It introduces the basic working principles, the operational knowhow, and the strength and limitations of the techniques. It will discuss and train students of the following techniques:

1. Noise and data analysis
PHYS8551 Topics in solid state physics
This course covers a broad introduction to modern theory of the solid state physics. Some selected advanced topics will also be discussed. Topics include: Crystal structures and symmetry; the reciprocal lattice and X-ray diffraction; lattice vibration and thermal properties; free electron of metals; band structures and Bloch theory; nearly free electrons and tight binding approximations; semiclassical model of electron dynamics; Boltzmann equation; transport and optical properties of metals and semiconductors; interaction and collective excitations. If time permits, magnetism and superconductivity will also be covered.

PHYS8552 Condensed matter physics
This course introduces many-body physics in quantum matter. Systems consisting of many particles (bosons or fermions) display novel collective phenomena that individual particles do not have, for example, ferromagnetism and superfluidity. It aims to introduce students the general principles behind these phenomena, such as elementary excitations, spontaneous symmetry breaking, and topological phases of matter. This course is intended for both experimentalists and theorists. While there are no official prerequisites, students who would like to take this course are assumed to have sufficient knowledge on quantum mechanics and statistical mechanics.

PHYS8654 General relativity
This course serves as a graduate level introduction to general relativity. It provides conceptual skills and analytical tools necessary for astrophysical and cosmological applications of the theory. Topics include: The principle of equivalence; inertial observers in a curved space-time; vectors and tensors; parallel transport and covariant differentiation; the Riemann tensor; the stress-energy tensor; the Einstein gravitational field equations; the Schwarzschild solution; black holes; gravitational waves detected by LIGO, and Freidmann equation.

PHYS8655 Topics in astrophysics
This course covers high energy processes, basic theory of stellar structure and evolution, and introduction to compact objects. It follows a vigorous mathematical treatment that stresses the underlying physical processes. Topics include: Radiation mechanisms; stellar structure equations; polytropic model; elementary stellar radiation processes; simple stellar nuclear processes; stellar formation; late stage of stellar evolution; supernova explosion; compact stellar; cosmic rays; numerical solving of stellar structure equation; if time permits, additional selected topics will be covered.

PHYS8656 General relativity
This course serves as a graduate level introduction to general relativity. It provides conceptual skills and analytical tools necessary for astrophysical and cosmological applications of the theory. Topics include: The principle of equivalence; inertial observers in a curved space-time; vectors and tensors; parallel transport and covariant differentiation; the Riemann tensor; the stress-energy tensor; the Einstein gravitational field equations; the Schwarzschild solution; black holes; gravitational waves detected by LIGO, and Freidmann equation.

PHYS8654 General relativity
This course serves as a graduate level introduction to general relativity. It provides conceptual skills and analytical tools necessary for astrophysical and cosmological applications of the theory. Topics include: The principle of equivalence; inertial observers in a curved space-time; vectors and tensors; parallel transport and covariant differentiation; the Riemann tensor; the stress-energy tensor; the Einstein gravitational field equations; the Schwarzschild solution; black holes; gravitational waves detected by LIGO, and Freidmann equation.
and yet classic semiconductor devices, microelectronic and optoelectronic. The course is primarily designed for postgraduates but can be of interest to senior undergraduates in physics, electrical and electronic engineering and materials science. Students are assumed to have acquired some basic knowledge of quantum mechanics, statistical mechanics, and solid state physics, though a review of the physics of semiconductors will be given in the beginning of the course. This course begins by giving a review of solid state physics, particularly the physics of semiconductors. It is then followed by discussions of the fundamentals and practical aspects of PN-junctions and rectifying diodes, amplifying and switching devices like bipolar and field-effect transistors (e.g. MOSFET), light-emitting and detection devices such as LEDs, laser diodes, and photodetectors. If time allows, a brief discussion of some special devices will be presented.

PHYS8850 Topics in particle physics
This course covers selected topics in both theoretical and experimental aspects of particle physics. Topics include: Fundamental particles; symmetry and conservation law; Feynman diagrams; electromagnetic interaction; weak interaction; strong interaction; particle accelerator and detector.

PHYS8852 Photonics and metamaterials
In the last two decades, tremendous progress has been made in the manipulation of light propagation using structured photonic media - metamaterials, with negative refraction, super-imaging and invisibility cloaking as the most well-known examples. These new discoveries are paving ways towards many potential applications of photonic structures, including imaging, display, holography and information processing. This course aims at providing the fundamental understanding of the interaction of light with structured media whose unit cells are much smaller than the wavelength of light, and the design and functionalities of various metamaterial based photonic devices. The course text is primarily designed for senior undergraduate students and postgraduate students and requires some knowledge on electromagnetism and optics. On the other hand, it will also be of interest to graduate students since it includes some most recent results in the field of metamaterials and nanophotonics. Topics include: Modeling of interaction of light with periodic structures, gratings, photonic crystals; coupled mode theory; interaction of light with metals, covering both propagating and localized surface plasmon polaritons; effective-medium description of the unconventional electromagnetic properties of metamaterials, such as negative permeability and negative refraction, zero refraction index, hyperbolic metamaterials, chirality and bi-anisotropy; design of the unit cells of the metamaterials based on plasmonic structures for achieving various electromagnetic properties and functionalities; transformation optics and invisibility cloaks; metamaterial devices, including super-imaging lenses, meta-lenses, metasurface holography etc.; nonlinear optical properties of metamaterials and metasurfaces; photonic systems with Parity-time symmetry; metamaterial approach for designing the topological properties for light.

PHYS8152 Data analysis in physics, astronomy and space science
This course introduces concepts of data analysis in physics, astronomy and space science. Techniques ranging from traditional statistical methods to more recent machine learning methods will be introduced. Applications of these techniques in physics, astronomy and space science will be the focus in this course for students to understand how they are deployed in solving actual problems.

PHYS8153 Big data, AI and machine learning in physics, astronomy and space science
Artificial intelligence (AI), Machine Learning and Big Data analytics have found widespread applications in all branches of science and technology. The objective of this course is to introduce concepts of AI and big data analytics, with focus on their applications in physics, astronomy and space science. Selected advanced examples on how big data science and deep learning can be applied in physics, astronomy and space science will be introduced to provide students a flavor of the contemporary research in the field.
WHAT YOU WILL LEARN

**Programme Highlights**

**Capstone Requirement**

**PHYS8971 Capstone project**

This capstone course provides students with the opportunity to study a specific research-type problem by themselves, either theoretical, experimental or numerical, under the supervision of an academic staff using the knowledge the student gained in their entire MSc study. For theoretical and numerical projects: Students will receive training in research literature reading and reviewing, and make investigation which is close to research work in nature, under the supervision of a staff member. Students may need to perform some original calculations, to fill in mathematical gaps of some sophisticated derivations, or a combination of both. For numerical projects, students also need to use computers to find numerical or simulation results. For experimental projects: Students will carry out experiments in research labs under the supervision of a staff member. Students will receive a comprehensive training in advanced experimental techniques, including preparation of samples, determination of physical properties, measurement of small signals obscured by noise, laser, high-vacuum and low-temperature techniques and so on. Wide reading of the relevant scientific literature and originality in experimental design are expected. It is expected that most of the projects would involve team work.

Pre-requisites: Pass or already enrolled in PHYS8201 and PHYS8970.

**Course Descriptions**

The Master of Science in Physics programme in the Physics Department, The University of Hong Kong aims to further equip university graduates with physics or related backgrounds for various career pathways. This programme provides students an opportunity to learn a wide range of advanced topics in theoretical, computational and experimental physics via taught courses and a capstone research project. Through the systematic postgraduate training in selective subject areas including astronomy, condensed matter physics, device and nano-physic, photonics and quantum information science, students can deepen and broaden their understanding of physics, and gain transferable skills for both fundamental research and career prospects. As a top tier cohort in physics research and higher education in Asia, the Physics Department is dedicated to nurturing students to achieve their educational goals and beyond.
Admissions
Requirements
◊ A Bachelor’s degree or above (equivalent qualification) in a relevant Science subject (e.g. Physics, Astronomy, Earth Sciences, Mathematics) or an Engineering discipline
◊ Prior knowledge in university-level electromagnetism, quantum mechanics and thermodynamics, university-level linear algebra and multi-variable calculus, basic statistics, and some computer programming experience (e.g. coding in C++, Mathematica, Matlab or Python)
◊ Shall pass a qualifying examination if deemed necessary
◊ Fulfil the University Entrance Requirements

How to apply
Application deadlines:
Non-local applicants: 12:00 noon (GMT +8), April 30, 2024
Local applicants: 12:00 noon (GMT +8), June 28, 2024
Online application: admissions.hku.hk/tpg

Expected degree conferment will take place in
November/December 2025 (Winter Congregation)
