SYLLABUSES FOR THE DEGREES OF
BACHELOR OF SCIENCE AND MASTER OF RESEARCH
(BSc&MRes)

A. Curriculum Structure

Each student must complete at least 240 credits in their Bachelor of Science (BSc) degree and 63 credits in the Master of Research (MRes) degree, with a total 303 credits for these 2 degrees.

The BSc Degree (240 credits):

To complete the BSc degree curriculum, you have to pass at least 240 credits, equivalent to 40 6-credit courses, which comprises:

(i) UG5:
- 2 English courses and 1 Chinese course for university language requirements (18 credits)
- 4 common core courses, including one course from each Area of Inquiry (24 credits)
- any other non-credit bearing courses as required (0 credit)

(ii) Intensive Science major:
- 24 - 25 courses for the intensive Science major including 2 Science Foundation courses, Disciplinary courses and capstone course(s) (144 - 150 credits)
- A choice of 8 - 9 courses as elective courses, or to fulfill the requirements of a minor (36-48 credits)

The intensive science majors available include the followings:

- Biological Sciences (Intensive)
- Chemistry (Intensive)
- Ecology & Biodiversity (Intensive)
- Geology (Intensive)
- Mathematics (Intensive)
- Molecular Biology & Biotechnology (Intensive)
- Physics (Intensive)

The syllabuses of the intensive science majors can be found at https://webapp.science.hku.hk/sr4/servlet/enquiry

The MRes Degree (63 credits):

The MRes of the programme consists of course work and research project. Each student must complete at least 63 credits, including one compulsory course on research ethics (3 credits), 18 credits of Faculty-offered Research Postgraduate courses, and 42 credits of a research project. The project report of the research project will be in the form of a literature review paper and an original
research paper in the relevant field. The below shows the current course list of the MRes component which is updated on a regular basis under the current quality assurance mechanism:

**Core Course**

INRE6033 Research Ethics for Graduate Students (Faculty of Science) (3 credits)

**Elective Courses** (6 credits each)

Remarks: * Course offered by sister institutions under Joint Centre for Advanced Study (JCAS), subject to further confirmation

**Capstone Project**

INRE7999 Research Project (42 credits)
Course contents

For the BSc:
Course contents of the courses prescribed in the BSc curriculum can be found at https://webapp.science.hku.hk/sr4/servlet/enquiry

For the MRes:

INRE6033 Research Ethics for Graduate Students (Faculty of Science)
The aims of this course are to reinforce the importance that the University places on the preservation of the values and principles of research integrity in all research conducted at the university; and to provide opportunities for students to further examine and discuss responsible conduct of research in their own disciplines, thereby enabling them to apply the principles and practices in their research field.

Students complete this course by fulfilling the course requirements in
GRSC6101 Responsible Conduct of Research: https://gradsch.hku.hk/sites/default/files/content/4_current_students/coursework/general_coursework_requirements/GRSC6101.pdf, and
GRSC6102 Stream-based Responsible Conduct of Research: https://gradsch.hku.hk/sites/default/files/content/4_current_students/coursework/general_coursework_requirements/GRSC6102.pdf in the same semester.

Assessment: Course work (100%)

BIOL6007 Biostatistics
This course aims to introduce students to the core ideas and concepts of statistical analysis with special attention to the modeling approaches used in biological sciences. The course will give students the skills and knowledge to understand how to apply these concepts using the R statistical programming language for data analysis. Although the course covers some basic concepts (experimental design, distributions, hypothesis testing), the main emphasis of the course is on model building and selection, linear models (regression and analysis of variance), basic random effects and mixed effects models.
Assessment: Assignments (40%) and Test (60%)

BIOL6014 Guided Study in Molecular and Cell Biology
This course aims at providing the student a guided approach to his/her chosen area of research study in endocrinology or microbiology. The guided study is coordinated by the student’s research supervisor. Students are required to consult their supervisors and select topics that are related to their research project(s).
Assessment: Written assignments (50-70%) and continuous assessment (30-50%)

BIOL6015 Advanced Experimental Techniques in Molecular and Cell Biology
This course focuses on advanced techniques in experimental animal and microbial sciences to assist the student’s research studies. The learning is coordinated and taught by the student’s research supervisor. Students are required to consult their supervisors and select topics related to
their thesis studies from and not limited to the following: Advances in Growth Hormone Research, Signal Transduction within Animal Cells, Cell Culture and Biosensing Techniques and Design, Cytochemical and Cytometry Techniques, Gene Cloning and Related Techniques, Laboratory Animal Handling and Surgical Techniques, Protein and Peptide Analysis and Synthesis, Transgenic Biotechnology in Animals, Advanced Immunoassays and Immunotechniques, Clinical Laboratory Techniques.
Assessment: Written assignments (50-70%) and continuous assessment of laboratory performance (30-50%)

BIOL8017 Advanced Studies in Environmental Sciences
This course aims to provide student centered learning opportunities which will be designed for each individual student. Students will be required to take parts of existing advanced courses from the BSc curriculum (Environmental Science major) which are considered necessary for their particular needs and which they have not previously taken.
Assessment: Examination (70-80%) and continuous assessment (20-30%) depending on the studies selected

BIOL8018 ‘Omics’ and Systems Biology
Recent progress in high-throughput omics technology has revolutionized the biological research. Genome-wide profiling of various biomolecules simultaneously by omics technology generates huge amounts of data, providing the potential to obtain a global and holistic view of the system. This course aims to introduce the technologies of Omics and Systems Biology, and overview of various applications of omics technology.

Synthetic biology is set to be the heart of future economy, promising to create new drugs, industrial materials and energy sources similar to chemical synthesis. The significance of this field has been promoted by the worldwide synthetic biology competition organized by MIT, i.e., iGEM competition. In this course, we will introduce some innovative ideas in synthetic biology and practice the skills needed for iGEM competition.
Assessment: Examination (50%) and assignment (50%)

BIOL8021 Presentation Skills and Research Seminars in Cell and Molecular Biology
This course aims to equip students with the skills needed to critique, construct and deliver scientific presentations effectively. Students are encouraged to think critically about the important elements of a good scientific presentation. The course will not only coach the students through the delivery of their own seminar, but also involving students in the preparation, discussion and analysis of seminars delivered by others.
Assessment: Course work (100%)

BIOL8022 Science Communication
This course aims to train the Ecology & Biodiversity research postgraduate to use a modern toolkit to develop effective communication of science while exploring other transferable skills related to professional development in the sciences.
Assessment: Course work (100%)

BIOL8023 Topics in Ecology & Biodiversity
This course aims to elevate RPg conceptual understanding of classic ecological concepts through the reading and discussion of classic papers in ecology and evolution.
Assessment: Course work (100%). Students will be expected to lead and participate in discussions.

**CHEM6101 Chemistry Seminars**
This course aims to provide students with the essential communication skills to give scientific presentation in both written and oral formats. Students taking this course will also have the chance to expose to recent development in frontier research in different areas of chemistry.
Assessment: Course work (100%)

**CHEM6102 Research Techniques in Chemistry**
This course aims to provide the principles and practice of some important and widely used research techniques in chemistry. Topics selected on the advice of the supervisor from: nuclear magnetic resonance spectroscopy and electron spin resonance spectroscopy, x-ray diffraction, mass spectrometry, material characterization, molecular modeling techniques, vibrational spectroscopy, laser spectroscopy, separation techniques, combinatorial chemistry.
Assessment: One 3-hour written examination (100%)

**CHEM6103 Special Topics in Chemistry**
This course aims to provide more advanced treatment in topics in chemistry. A research topic selected on the advice of the supervisor from: selected advanced topics of current interest in analytical chemistry, inorganic chemistry, organometallic chemistry, organic chemistry, physical chemistry and theoretical chemistry, etc.
Assessment: A written report of no less than 2,500 words (100%) to be submitted at the end of the course.

**CHEM6108 Introduction to Macromolecules (CUHK)**
This is a postgraduate course offered by the Joint Centre for Advanced Study. Lectures will be delivered by faculty members from CUHK, HKUST, and HKU. Both introduction to macromolecular science and some frontier topics will be covered. The lectures will be held at the campus of these three institutions. Details will be announced at the beginning of the class.
Assessment: One 3-hour written examination (100%)

**CHEM6109 Computational Chemistry**
This course covers common topics in computational chemistry including molecular quantum chemistry and dynamics methods as well as the fundamental in machine learning. Topics include basic concepts, computational theories and practical problems in chemistry. It is offered to undergraduate and postgraduate students who are interested in advanced computational chemistry techniques.
Assessment: Assignments (50%); Examination (50%)

**CHEM6111 Integrated Organic Synthesis**
This course will present modern synthetic methods and synthetic planning. The course is organized into units based on target drug molecules. In each unit, the chemical biology of these compounds are briefly presented and the syntheses of these molecules are introduced, accompanied by in-depth discussions of the reactions involved with emphasis on their mechanisms, selectivity, stereochemistry, scope and limitations. Concept of synthetic design including retrosynthetic analysis, stereoselectivity and enantioselective control elements will be emphasized. A laboratory section provides training in the practical skills of synthesis.
CHEM6112 Advanced Physical Chemistry
This course covers advanced topics in physical chemistry. It is offered for students majoring in physical chemistry and for students who are interested in postgraduate studies. The course contents & topics include time-resolved spectroscopy methods, excited states and reactive intermediates, photophysics and photochemical processes, chemical reaction mechanisms, advanced quantum mechanical methods, reaction pathways and surface crossings.
Assessment: Assignments (10%); Examination (50%); Laboratory reports (25%); Test (15%)

CHEM6113 Medicinal Chemistry
This course covers the chemical principles of drug design and drug action and uses as an introduction to research in areas of bioorganic chemistry, bioinorganic chemistry, medicinal chemistry, pharmaceutical chemistry, and biotechnology. The course contents & topics include Drug discovery, design, and development: lead discovery, pharmacophore, structure-activity relationships (SAR), computer-aided drug design, combinatorial chemistry and high-throughput drug screening, Drug-receptor interactions, Proteins (and enzymes) and nucleic acids as drug targets, Metals in medicine, DNA-Drug interactions, Drug metabolism and prodrugs and drug delivery.
Assessment: Assignments (30%); Examination (50%); Test (20%)

CHEM6114 Advanced Organic Chemistry
This course aims to provide students with knowledge in organic chemistry reaction mechanism and organic compound structure determination. The course covers chemical bonding, advanced stereochemistry, conformational analysis, techniques for investigating reaction mechanisms, reactive intermediates, rearrangement reactions, and pericyclic reactions.
Assessment: Assignments (25%); Examination (50%); Test (25%)

CHEM6115 Advanced Inorganic Chemistry
This course is to give further and more detailed treatment to topics in Inorganic Chemistry and new areas of interest. Problem based learning on selected advance topics will be introduced in the later part of the course. Selected advanced topics of current interest. Examples include metal-metal bonds and metalligand multiple bonds, inorganic and supramolecular photochemistry, lanthanide chemistry, bio-inorganic and medicinal chemistry, and activation of small molecules by metal complexes.
Assessment: Assignments (25%); Examination (50%); Test (25%)

CHEM6116 Symmetry, Group Theory and Applications
This course aims to introduce the concepts of symmetry and group theory and to apply them in solving chemical problems. This course also provides an introductory treatment of bonding theories, inorganic electronic and vibrational spectroscopy. The course contents & topics includes Symmetry elements and symmetry operations; symmetry point groups; reducible and irreducible representations; character tables; direct products; symmetry-adapted linear combinations; projection operators; hybrid orbitals; molecular orbital theory for organic, inorganic and organometallic systems; selected applications in electronic and vibrational spectroscopy.
Assessment: Assignments (25%); Examination (50%); Test (25%)

CHEM6117 Modern Chemical Instrumentation and Applications
This course aim of the course is to provide an understanding of modern instrumentation, covering both fundamental principles and practical aspects of instrument design. The course will be of particular benefit to those pursuing a higher research degree or a career in technical sales/service. Assessment: Assignments (10%); Examination (50%); Laboratory reports (25%); Test (15%)

CHEM6118 Frontiers in Modern Chemical Science
This course aims to introduce students to the newest concepts and technological breakthroughs in chemical sciences. Throughout the course, students will be introduced to how the interplay among molecules, materials, and interfaces leads to unprecedented functionalities that contribute to innovations in biology and medicine, smart materials, and sustainable energy schemes. Assessment: Assignments (30%); Essay (35%); Presentation (35%)

EASC6001 Research Seminars and Presentation of Thesis Proposal
This course enables students to present their research proposals and receive a broad and timely suggestions and critiques. Students are required to present their thesis proposals, and should attend the weekly seminar series held in the department. Students are required to enroll for this course of their first year of their degree programs and orally present the thesis proposal (20-30 minute talk) before submitting their biannual progress reports. Assessment: Class participation in weekly seminars (50%) and presentation (50%); to be assessed by departmental staff members

EASC6005 Advanced Regional Geology
This course aims to provide an overview of the regional geology, including current major problem in regional geology (e.g., climate-erosion-tectonics interactions) and how multi-disciplinary approaches are used to solve regional geological questions (e.g., integration of thermochronology and tectonic reconstruction). Additional emphasis is placed on east Asian tectonics, as this our home region and a focal site of much regional geological discovery over the past ~ 40 years. A major project, each of which can be tailored to correspond with the research interests of the postgraduate student, will be the dominant graded element. Assessment: Continuous assessment (100%)

EASC6006 Special Topics in Earth and Planetary Sciences
This course aims to provide in depth knowledge of selected special topics in earth and planetary sciences, including engineering and environmental geology, hydrogeology, engineering geophysics, quaternary geology, astrobiology and planetary sciences. Directed studies in a focused field of research recommended by the research group/supervisor, and writing of review reports and critiques. Assessment: Continuous assessment (100%)

EASC6007 Mass Extinctions
This course aims to review five mass extinction events in earth history. The instructor will first explain the concepts of background extinction rate and major extinction events. Later students will learn the causes and effects for five mass extinction events. Additionally we will discuss if the 6th extinction event is coming. Assessment: Continuous assessment (100%)

EASC6009 Earth Systems Through Time
Assessment: Continuous assessment (100%)

EASC6010 Nanogeoscience
This course provides an overview of nanomaterial properties and nano-scale processes that take place in solids, fluids/droplets, vapors and across reacting interfaces with an emphasis on the Earth and environmental sciences.
Assessment: Continuous assessment (100%)

MATH6014 Topics in Advanced Numerical Analysis
This course delves into advanced topics in numerical analysis, providing students with a comprehensive understanding of key concepts and methods.
Assessment: Coursework (50%); Examination (50%)

MATH6015 Topics in Artificial Intelligence and Machine Learning
Selected topics in artificial intelligence that are of current interest will be discussed in this course.
Assessment: Coursework (50%); Examination (50%)

MATH6101 Intermediate Complex Analysis
The objective is to familiarize students with analytic, algebraic and geometric concepts and techniques in the study of Complex Analysis in a single variable beyond an introductory course on functions of a complex variable.
Assessment: Written midterm test and end-of-term assessment (100%)

MATH6219 Topics in Applied Functional Analysis
This is a graduate to advanced undergraduate university level course on applied functional analysis, which aims at introducing to students the basic knowledge of using functional analysis on various applied topics in mathematics. This course would lay a foundation for students in studying more advanced mathematical courses.
Assessment: Coursework (50%); Examination (50%)

MATH6224 Topics in Advanced Probability Theory
Depending on the instructor, this course focuses on selected topics in probability theory.
Assessment: Project reports (50%); Test (50%)

MATH6501 Topics in Algebra
To provide students specializing in mathematics with the opportunity to study some topics in algebra in greater depth.
Assessment: Assignments + Project (50%); Oral Presentation (50%)

MATH6502 Topics in Applied Discrete Mathematics
This is a follow-up of the course MATH3600. It introduces students to some powerful linear algebra and probabilistic methods that have been used with striking success in discrete
mathematics, and covers some of the most fundamental and beautiful results obtained by these methods.
Assessment: Coursework (50%); Examination (50%)

**MATH6503 Topics in Advanced Optimization**
To learn a selection of advanced and up-to-date topics in continuous optimization, including theory, numerical algorithms and applications.
Assessment: Assignment (10%); Essays (20%); Oral Presentation (20%); Research Project Report (30%); Written Midterm (20%)

**MATH6505 Real Analysis**
To introduce the basic ideas and techniques of measure theory and the Lebesgue integral.
Assessment: Coursework (50%); Examination (50%)

**PHYS8352 Quantum Information**
This course covers the theory of quantum information and computation and its applications in physics and computer science.
Assessment: Assignments (20%); Examination (50%); Test (30%)

**PHYS8552 Condensed Matter Physics**
This course introduces many-body physics in quantum matter. Systems consisting of many particles (bosons or fermions) display novel collective phenomena that individual particles do not have, for example, ferromagnetism and superfluidity. It aims to introduce students the general principles behind these phenomena, such as elementary excitations, spontaneous symmetry breaking, adiabatic theorems, emergent topological phases of matter, etc. Theoretical language useful in the interpretation of experiments, such as linear response theory and response functions, will be discussed. This course is intended for both experimentalists and theorists. While there are no official prerequisites, students who would like to take this course are assumed to have sufficient knowledge on quantum mechanics and statistical mechanics.
Assessment: Assignments (40%); Essay (60%)

**PHYS8701 Physics Experimental Techniques**
This course provides a detailed account of some common experimental techniques in physics research. It introduces the basic working principles, the operational knowhow, and the strength and limitations of the techniques.
Assessment: Attendance (20%); Presentation (40%); In class quizzes (40%)

**PHYS8751 Device Physics**
This course aims at presenting a comprehensive introductory account of the physics and operational principles of some selected and yet classic semiconductor devices, microelectronic and optoelectronic. The text is primarily designed for postgraduates but can be of interest to senior undergraduates in physics, electrical and electronic engineering and materials science. Students are assumed to have acquired some basic knowledge of quantum mechanics, statistical mechanics, and solid state physics, through a review of the physics and semiconductors will be given in the beginning of the course.
Assessment: Assignments (20%); Examination (50%); Test (30%)
**PHYS8852 Photonics and Metamaterials**
This course aims at providing the fundamental understanding of the interaction of light with structured media whose unit cells are much smaller than the wavelength of light, and the design and functionalities of various metamaterial-based photonic devices. The course text is primarily designed for senior undergraduate students and postgraduate students and requires some knowledge on electromagnetism and optics. On the other hand, it will also be of interest to graduate students since it includes some most recent results in the field of metamaterials and nanophotonics.
Assessment: Assignments (50%); Examination (50%)

**INRE7999 Research Project**
This course aims at providing students with an opportunity to pursue their own research interest under the supervision of a teacher. The period of the research project will last for the 1st semester, 2nd semester until the summer semester.
Assessment: Project report (80%); Oral examination (20%)
